With **RLM PLM**, you can effectively reduce time-to-market by streamlining communication with vendors. It provides a standardized means of communicating with design and product development departments, and increases management visibility into product development activities and costs. **The Product Lifecycle Management** software module enables everyone to make better informed and more timely decisions.

RLM PLM time and action calendars will track overseas production to ensure on-time production and delivery to customers. It also tracks labeling purchases to shore-to-shore and other vendors, and automates the process by communicating label needs electronically, specific to finished goods production needs.

The **RLM PLM** software module is fully integrated with the **RLM Apparel Software Suite** and is available in cloud-based subscription with low startup costs.
